Markov chains: Background

- Markov chain is a generalization of Law of Large Numbers.
- Law of Large Numbers: assumes that every random outcome that we generate is independent of the previous outcomes.
- Markov chain: is called a memoryless process. The idea is that it has “short-term memory” – the future depends only on the current state of the process. This is the key assumption underlying Markov chains.
- Example: Class all <https://eduassistpro.github.io/>

The

probabilities are:

$$P(S)=91.5\%$$

$$P(G)=8.5\%$$

Assignment Project Exam Help

Markov chains: applications

- Examples of Markov chains applications

- Describing communication systems
- Queueing systems
- Signal processing
- Manufacturing
- Music: for example, the probability of a song being a hit
- Finance. Today's stock prices are a function of yesterday's stock prices.

Question: What is the probability for different scenarios?

Price a bond based on expected return

Add WeChat edu_assist_pro
(as opposed to n)

Need to consider how to model bond default:

- Probability of default at a given time
- Percentage of principal that will be recovered in case of default

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Expected pay off from a one-year bond

Add WeChat edu_assist_pro

Symbol	Definition
F	Face value
q	Annual promised coupon rate (%)
π_D	Probability of default
λ	Fraction of face value to collect in case of default

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

$$\text{Expected Payoff} = \underbrace{\lambda F}_{\text{default}} + \underbrace{(1 - \pi_D) \cdot (F + qF)}_{\text{no_default_at_maturity}}$$

Expected payments from a two-year bond

Add WeChat edu_assist_pro

Symbol	Definition
F	Face value
q	Annual promised coupon rate (%)
π_D^1	Probability of default in year 1
π_D^2	Probability of default in year 2, given that there was no default i
λ	Fraction to collect in case of default

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

$$\text{Exp. Payoff Year 1} = \overbrace{\pi_D^1 \cdot \lambda F}^{\text{default_year_1}} + \overbrace{(1 - \pi_D^1) \cdot qF}^{\text{no_default_year_1}}$$

$$\text{Exp. Payoff Year 2} = \overbrace{\pi_D^1 \cdot 0}^{\text{already_in_default}} + \overbrace{(1 - \pi_D^1) \cdot \left(\underbrace{\pi_D^2 \cdot \lambda F}_{\text{default_year_2}} + \underbrace{(1 - \pi_D^2) \cdot (1 + q) F}_{\text{no_default_year_2}} \right)}^{\text{no_default_year_1}}$$

A simplified model of upgrades and downgrades depends on the *latest* rating

Add WeChat edu_assist_pro

probability of transition during *one period* to rating:

Rating	Interpretation	A	B	D	E
A	Highest quality, pays as promised	99%	1%	0	0
B	Next highest, pays as promised	3%	96%	1%	0
D	First time default, percentage	0	0	0	100%
E	Defaulted in a previous period, paid nothing	0	0	0	100%

<https://eduassistpro.github.io/>

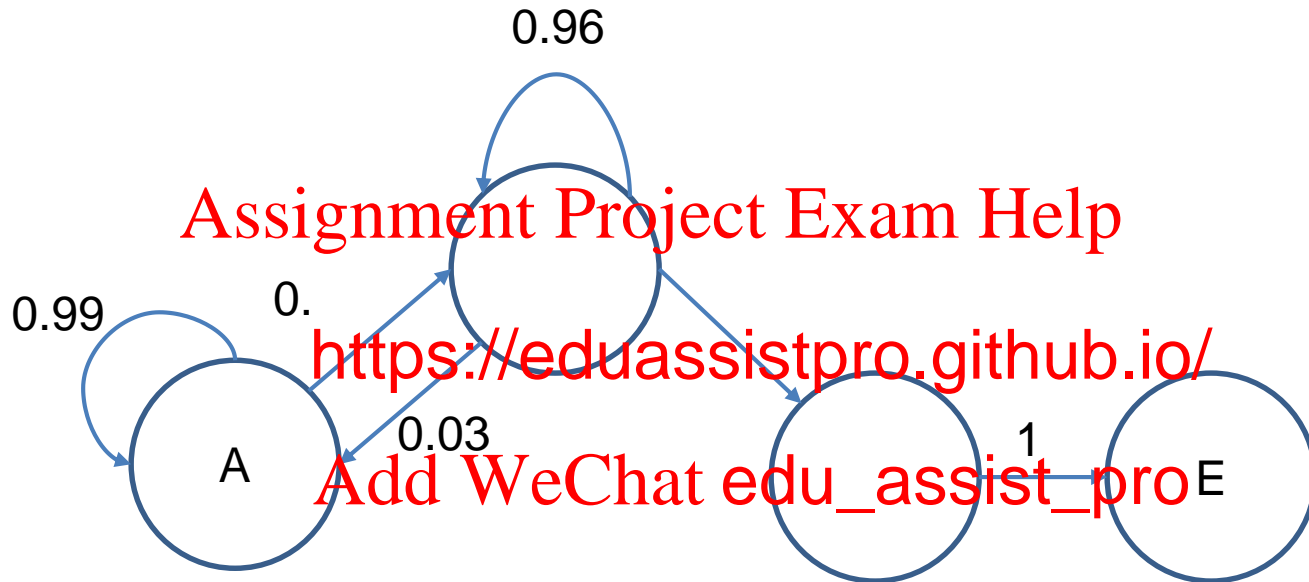

Add WeChat edu_assist_pro

- The lower the ranking, the higher the probability of going into default.
- Possible to get payment only upon initial default, hence two default states (*D* and *E*) are needed for the model.

Add WeChat edu_assist_pro

$$\Pi = \begin{bmatrix} .99 & .01 & 0 & 0 \\ .03 & .96 & .01 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} \pi_{AA} & \pi_{AB} & \pi_{AD} & \pi_{AE} \\ \pi_{BA} & \pi_{BB} & \pi_{BD} & \pi_{BE} \\ \pi_{DA} & \pi_{DB} & \pi_{DD} & \pi_{DE} \\ \pi & & & \end{bmatrix}$$

Assignment Project Exam Help

- Say we start with an A-rated bond over one period: it can happen to default, or get downgraded to B. The probability of going into default, π_{AD} , is zero.

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

So if the bond matures in one period, what payout should we expect?

$$\underbrace{(\pi_{AA} + \pi_{AB}) \cdot (1 + q) F}_{\text{not_in_default_and_at_maturity}} + \underbrace{\pi_{AD} \cdot \lambda F}_{\text{just_defaulted}} + \pi_{AE} \cdot 0_{\text{already_in_default}}$$

Second period transition probability

In this model, what will happen to the bond in the second period? Given data in our model, it can end up either rated A or B or it can go into default for the first time:

$$\begin{bmatrix} \pi_{AA} & \pi_{AB} & 0 & 0 \\ \pi_{BA} & \pi_{BB} & \pi_{BD} & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$\pi_{AA}^2 = \pi_{AA} \cdot \pi_{AA} + \pi_{AB} \cdot \pi_{BA}$$

$$\pi_{AB}^2 = \pi_{AA} \cdot \pi_{AB} + \pi_{AB} \cdot \pi_{BB}$$

$$\pi_{AE}^2 = 0$$

So if the bond matures in the second period, what should we expect in the second period?

$$\underbrace{\left(\pi_{AA}^2 + \pi_{AB}^2 \right) \cdot (1+q) F}_{\text{not_in_default_and_at_maturity}} + \underbrace{\pi_{AD}^2 \cdot \lambda F}_{\text{just_defaulted}} + \underbrace{\pi_{AE}^2 \cdot 0}_{\text{already_in_default}}$$

Assignment Project Exam Help

Expected payout in period n

Add WeChat edu_assist_pro

If we start out with an A-rated bond, we can calculate the expected payout in period n .

If n is prior to maturity:

$$\underbrace{(\pi_{AA}^n + \pi_{AB}^n) \cdot qF}_{\text{not_in_default_and_before_maturity}} + \underbrace{\pi_{AD}^n \cdot \lambda F}_{\text{just_defaulted}} + \underbrace{\pi_{AE}^n \cdot 0}_{\text{already_in_default}}$$

If n is at maturity, face value + the coupon

<https://eduassistpro.github.io/>

$$\underbrace{(\pi_{AA}^n + \pi_{AB}^n) \cdot (1 + q)F}_{\text{matured_and_not_in_default}} + \underbrace{\pi_{AD}^n \cdot \lambda F}_{\text{just_defaulted}} + \underbrace{\pi_{AE}^n \cdot 0}_{\text{already_in_default}}$$

After maturity we do not expect any cash flows...

How to calculate the n -period transition probabilities?

We can think of transitions as two-step: we consider the rating in period $n-1$, and then the next one-period transition:

$$\pi_{AA}^n = \pi_{AA}^{n-1} \cdot \pi_{AA} + \pi_{AB}^{n-1} \cdot \pi_{BA}$$

$$\pi_{AB}^n = \pi_{AA}^{n-1} \cdot \pi_{AB} + \pi_{AB}^{n-1} \cdot \pi_{BB}$$

$$\pi_{AD}^n = \pi_{AD}^{n-1} \cdot \pi_{BD}$$

$$\pi_{AE}^n = \pi_{AD}^{n-1} \cdot 1 + \pi_{AE}^{n-1} \cdot 1$$

We use matrices multiplication:

$$\begin{bmatrix} \pi_{AA}^n & \pi_{AB}^n & \pi_{AD}^n & \pi_{AE}^n \end{bmatrix} = \begin{bmatrix} \pi_{AA}^{n-1} & \pi_{AB}^{n-1} & \pi_{AD}^{n-1} & \pi_{AE}^{n-1} \end{bmatrix} \begin{bmatrix} \pi_{AA} & \pi_{AB} & 0 & 0 \\ \pi_{BA} & \pi_{BB} & \pi_{BD} & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

Assignment Project Exam Help

Add WeChat edu_assist_pro

Another way to find the probabilities in period n for a bond initially rated A is to multiply the initial probabilities by the transition matrix n times

Assignment Project Exam Help

$$\begin{bmatrix} \pi_{AA}^n & \pi_{AB}^n & \pi_{AD}^n & \pi_{AE}^n \\ 0 & 0 & 0 & 1 \end{bmatrix}^n$$

Assignment Project Exam Help

Hints

Add WeChat edu_assist_pro

- Think about creating a schedule of payoffs every year.
- Start out testing your spreadsheet with the A-rated bond
- Use Excel NPV function to calculate the PV of the bond.
- What is the NPV discount rate implied by the fact that the A-rated bond is sold at par?
- Use Excel's Goal Seek to find the appropriate coupon rate for the B-rated bond.
